#### Abstract

The average connectivity $\bar{\kappa}(G)=\frac{\sum_{u, v} \mathrm{k}_{\mathrm{G}}(\mathrm{u}, \mathrm{v})}{\binom{v}{2}}, \mathrm{KG}(\mathrm{u}, \mathrm{v})$ is defined to be the maximum value of k for which u and v are k -connected. In this paper, we consider the concept of the average connectivity of an arithmetic graph. It is shown that $\bar{\kappa}(G) \leq \frac{\left[(v-2)\binom{0-\beta}{2}+(v-\beta)\binom{\beta}{2}+(v-\beta)^{2} \beta\right]}{\binom{0}{2}}$ where $v$ is the order and $\beta$ is an independence number of an arithmetic graph. Also, it is clear that, if $a_{1}$ is increasing then $\bar{\kappa}(G)$ is decreasing for an arithmetic graph $G=V n$, where $n=P_{1}{ }^{a_{1}} \times P_{2}$.

Keywords: Average Connectivity, Arithmetic Graph, Total Connectivity.
AMS subject classification: 05C12

## 1. Introduction

A graph $G$ is an ordered $\operatorname{triple}\left(V(G), E(G), \Psi_{G}\right)$ consisting of an nonempty set $V(G)$ of vertices, a set $E(G)$ of edges and an incidence function $\Psi_{G}$, that associates with each edge of $G$ an unordered pair of vertices of $G$. The number of vertices in $G$ is denoted by $v=|V(G)|$ is called the order of $G$ while the number of edges in $G$ is denoted by $\varepsilon=|E(G)|$ is called the size of the graph $G$. A graph of order $v$ and size is called $(v, \varepsilon)$ graph. A graph is simple if it has no loops and no two of its links join the same pair of vertices. A simple graph in which each pair of distinct vertices is joined by an edge is called complete graph. The degree of a vertex $v$ in a graph $G$ is the number of edges of $G$ incident with $v$ and is denoted by $\operatorname{deg}_{G} v$ or $d(v)$.A vertex of degree one is called a pendent vertex or an end vertex of $G$. The maximum and minimum degree of a graph $G$ is denoted by $\Delta(G)$ and $\square(G)$ respectively.

A vertex $v$ of $G$ is a cut vertex if $E$ can be partitioned into $E_{1}$ and $E_{2}$ such that $G\left[E_{1}\right]$ and $G\left[E_{2}\right]$ have just the vertex $v$ in common. A bipartite graph $G$ is a graph whose vertex set $V(G)$ can be partitioned into two subsets $V_{1}$ and $V_{2}$ such that every edge of $G$ joins $V_{1}$ with $V_{2} ;(V 1, V 2)$ is a bipartition of $G$. A graph $G$ is called acyclic if it has no cycles. A connected acyclic graph is called a tree. A non trivial path is a tree with exactly two end vertices. A family of paths in $G$ is said to be internally disjoint if no vertex of $G$ is
an internal vertex of more than one path of the family. The arithmetic graph $G=V_{n}$ is introduced by Vasumathi. N and Vangipuram. S in [6] and later it was studied by various authors in [3, 4, 5]. It is defined as, a graph with its vertex set is the set consists of the divisors of $n$ (excluding 1 ) where $n$ is a positive integer and $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \ldots \ldots \ldots P_{r}{ }^{a_{r}}$ where $P_{\mathrm{i}}$ 's are distinct primes and $a_{i}$ 's $\geq 1$ and two distinct vertices $a, b$ which are not of the same parity are adjacent to this graph if $(a, b)=P_{\mathrm{i}}$ for some $i, 1 \leq i \leq r$. The vertices $a$ and $b$ are said to be of the same parity if both $a$ and $b$ are the powers of the same prime, for instance $a=P^{2}, b=P^{5}$. Throughout the paper $G$ is a simple connected graph with at least three vertices. The following observations are used in the sequel.

Observation 1.1.[4]Let $G=V_{n}$ be an arithmetic graph where $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a} \times \ldots \ldots \ldots$ $P_{r}{ }^{a_{r}}$ the number of vertices of $G$ is $|V|=\left[\prod_{i=1}^{r}\left(a_{i}+1\right)\right]-1$.

Observation 1.2.[3]Let $G=V_{n}$ be an arithmetic graph where $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \times \ldots \ldots \ldots \times$ $P_{r}{ }^{a_{r}}, a_{i}=1 \forall \mathrm{i} \in\{1,2,3, \ldots r\}$.Then
(1) $\Delta(G)=2^{r-1}$
(2) $\square(G)= \begin{cases}r, & r \geq 3 \\ 1, & r=2\end{cases}$

Observation 1.3.[4]Let $G=V_{\mathrm{n}}$ be an arithmetic graph where $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \times \ldots \ldots \ldots \times P_{r}{ }^{a_{r}}$, at least one $a_{i}>1$.Then $(G)=r$ and $\Delta(\mathrm{G})=a_{j} \prod_{\substack{i=1 \\ i \neq j}}^{r}\left(a_{i}+1\right)-1$, where $a_{j}$ is the maximum exponent of $P_{\mathrm{i}}$, i $\in\{1,2,3 \ldots r\}$

Observation 1.4.[1] $\sum_{v \in V} d(v)=2 \varepsilon$

## 2. Average Connectivity

The definition of an average connectivity is studied from [2] and is determined the same for arithmetic graphs.
Definition 2.1.[2]
The average connectivity $\bar{\kappa}(G)=\frac{\sum_{u, v} \kappa_{G}(u, v)}{\binom{v}{2}}, \kappa_{G}(u, v)$ is defined to be the maximum value of $k$ for which $u$ and $v$ are $k$-connected. If the order of $G$ is $v$, then the average connectivity $\bar{\kappa}(G)=\frac{\sum_{u, v} \kappa_{G}(u, v)}{\binom{v}{2}}$, the expression $\sum_{u, v} \kappa_{G}(u, v)$ is sometimes referred to as the total connectivity of $G$.

Remark 2.2. Maximum number of internally disjoint paths between $v_{\mathrm{i}}$ and $v_{\mathrm{j}}$ are less than or equal to $\min \left(\operatorname{deg}\left(v_{\mathrm{i}}\right), \operatorname{deg}\left(v_{\mathrm{j}}\right)\right)$.

Theorem 2.3. For an arithmetic graph $G=V_{n}$
(i) $\bar{\kappa}(G)=1$ if $n=P_{1} \times P_{2}$.
(ii) $\bar{\kappa}(G)<2^{\mathrm{r}-1}$ if $n=P_{1} \times P_{2} \times P_{3} \times \ldots \times P_{r}$.
(iii) $\bar{\kappa}(G)<a_{j} \prod_{\substack{i=1 \\ i \neq j}}^{r}\left(a_{i}+1\right)-1$ if $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \times \ldots \ldots \ldots \times P_{r}^{a_{r}}$.

## Proof.

(i)In this case, the given arithmetic graph is a non-trivial tree, and hence the result is obvious.
(ii)Let $G=V_{\mathrm{n}}$ be an arithmetic graph where $n=P_{1} \times P_{2} \times P_{3} \times \ldots \times P_{r}$. By observation1.1, 1.2 and remark 2.1, and also the arithmetic graph is not regular we get the average connectivity $\bar{\kappa}(G)<2^{r-1}$
(iii)In this case, the given arithmetic graph $G=V_{\mathrm{n}}$ where $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \ldots \ldots \ldots \times P_{r}{ }^{a_{r}}$ has maximum degree $a_{j} \prod_{\substack{i=1 \\ i \neq j}}^{r}\left(a_{i}+1\right)$-1. Since the graph is not regular

$$
\bar{\kappa}(G)<a_{j} \prod_{\substack{i=1 \\ i \neq j}}^{r}\left(a_{i}+1\right)-1
$$

Theorem 2.4. Let $G=V_{n}$ where $n=P_{1} \times P_{2} \times P_{3} \times \ldots \times P_{r}$ be an arithmetic graph of order $v=2^{r}-1$ and an independence number $\beta$, then $\bar{\kappa}(G) \leq \frac{\left[2^{r-1}\binom{v-\beta}{2}+(v-\beta)\binom{\beta}{2}+(v-\beta)^{2} \beta\right]}{\binom{v}{2}}$.

Proof. Consider the arithmetic graph $G=V_{n}$ where $n=P_{1} \times P_{2} \times P_{3} \times \ldots \times P_{r}$ of order $2^{r}-1$. Let $S$ be the set of independent vertices with $|S|=\beta$.

Since by observation1.1,1.2 and remark 2.1, the average connectivity between any two pair of verticesis at most $2^{r-1}$. Therefore, the total connectivity of $G$ is the sum of the following cases, the vertices which are in $S$ and not in $S$

Case (i) If $u, v \notin S$ then the total connectivity $\sum_{u, v \notin S} \kappa_{G}(u, v)$ is at most $2^{\mathrm{r}-1}\binom{v-\beta}{2}$
Case (ii) If uorv (or both) is in $S$ then the total connectivity is at $\operatorname{most}(v-\beta)$.Hence for these pairs $\sum_{u, v} \kappa_{G}(u, v)$ will be at most $\left.(v-\beta)\left[\begin{array}{c}\beta \\ 2\end{array}\right)+(v-\beta) \beta\right]$

Theorem 2.5. Let $G=V_{n}$ be an arithmetic graph of order $v$ and independence number $\beta$, where $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \ldots \ldots \ldots \times P_{r}{ }^{a_{r}}$ and $n \neq P_{1} \times P_{2}$, then $\bar{\kappa}(G) \leq \frac{\left[(v-2)\binom{v-\beta}{2}+(v-\beta)\binom{\beta}{2}+(v-\beta)^{2} \beta\right]}{\binom{v}{2}}$.

Proof. Let $G$ be an arithmetic graph withvvertices and independence number $\beta$, and let $S$ be a set of independent vertices such that $|S|=\beta$. Since the arithmetic graph is not complete, the connectivity between any pair of vertices in $G$ is at mostv-2, so the contribution to the total connectivity of $G$ of the pairs of vertices not in $S$ is bounded by $(v-2)\binom{v-\beta}{2}$.

On the other hand, if uorv (or both) is in $S$ then $\mathrm{k}_{G}(u, v) \leq v-\beta$, so such pairs contribute at $\operatorname{most}(v-$ $\beta)\binom{\beta}{2}+(v-\beta)^{2} \beta$ to the total connectivity. Addition of these two contributions gives the desired result.

Corollary 2.6.Let $G=V_{\mathrm{n}}$ be an arithmetic graph where $n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}} \times P_{3}{ }^{a_{3}} \ldots \ldots \ldots \times P_{r}{ }^{a_{r}}$
at least one $a_{i}>1$ with order $v=\left[\prod_{i=1}^{r}\left(a_{i}+1\right)\right]-1$ and independence number $\beta$ then $\bar{\kappa}(G) \leq$ $\frac{\left[\begin{array}{c}\left.\left[a_{j} \prod_{i=1}^{r}\left(a_{i}+1\right)-1\right]\binom{v-\beta}{i \neq j}+(v-\beta)\binom{\beta}{2}+(v-\beta)^{2} \beta\right]\end{array}\right.}{\binom{v}{2}}$, where $a_{j}$ is the maximum exponent of $P_{i}$.

Proof. The result is obvious from theorem 2.4.
Theorem2.7.For an arithmetic graph $G=V_{n}, n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}}, a_{1}, a_{2} \geq 1$ then $\varepsilon=4 a_{1} a_{2}-a_{1}-a_{2}$, where $\varepsilon$ is the size of the graph $G$.

Proof. The vertex set $V(G)$ contains primes, prime powers, and product of powers. The neighbors of $P_{1}$ is a set $N\left(P_{1}\right)$,containing vertices, which are the Cartesian product of the sets $\left\{P_{1}, P_{1}{ }^{2}, P_{1}{ }^{3} \ldots, P_{1}{ }^{a_{1}}\right\}$ and $\left\{P_{2}, P_{2}{ }^{2}, P_{2}{ }^{3} \ldots, P_{2}{ }^{a^{2}}\right\}$. Similarly the vertices of $\mathrm{N}\left(P_{2}\right)$.

The vertices $P_{1}{ }^{a_{1}}, a_{1}>1$ are adjacent to $P_{1} \times P_{2}, P_{1} \times P_{2}{ }^{2}, \ldots \ldots \ldots, P_{1} \times P_{2}{ }^{a_{2}}$. Also the vertices $P_{2}{ }^{a_{2}}, a_{2}>1$ are adjacent to $P_{1} \times P_{2}, P_{1}{ }^{2} \times P_{2}, \ldots \ldots P_{1}{ }^{a_{1}} \times$
$P_{2}$.Thevertices $P_{1}{ }^{a_{1}} \times P_{2}, a_{1}$ 1areadjacentto $P_{1,}, P_{2}, P_{2}{ }^{2}, P_{2}{ }^{3} \ldots, P_{2}{ }^{a_{2}}$. Similarly, the vertices of the form $P$ ${ }_{1} \times P_{2}{ }^{a_{2}}, a_{2} \geq 1$ are adjacent to $P_{1,}, P_{2}, P_{1}{ }^{2}, P_{1}{ }^{3} \ldots, P_{1}{ }^{a_{1}}$. If $a_{1}>1$ and $a_{2}>1$ then $P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}}$ is adjacent only to $P_{1}$ and $P_{2}$. Hence the degrees of the vertices are given by

$$
\begin{aligned}
& d(v)=\left\{\begin{array}{ccl}
a_{1} a_{2} & \text { if } & v=P_{1} \text { or } P_{2} \\
a_{2} & \text { if } & v=P_{1}{ }^{m}, 1<m \leq a_{1} \\
a_{1} & \text { if } & v=P_{2}{ }^{n}, 1<n \leq a_{2} \\
a_{1}+a_{2} & \text { if } & v=P_{1}{ }^{m} \times P_{2}{ }^{n} ; m, n=1 \\
a_{2}+1 & \text { if } & v=P_{1}{ }^{m} \times P_{2}{ }^{n} ; n=1,1<m \leq a_{1} \\
a_{1}+1 & \text { if } & v=P_{1}{ }^{m} \times P_{2}{ }^{n} ; m=1,1<n \leq a_{2} \\
2 & \text { if } & v=P_{1}{ }^{m} \times P_{2}{ }^{n}, 1<m \leq a_{1}, 1<n \leq a_{2}
\end{array}\right. \\
& \sum d(v)=2 a_{1} a_{2}+\left(a_{1}-1\right) a_{2}+\left(a_{2}-1\right) a_{1}+a_{1}+a_{2}+\left(a_{1}-1\right)\left(a_{2}+1\right)+\left(a_{2}-1\right)\left(a_{1}+1\right) \\
& +\left(a_{1}-1\right)\left(a_{2}-1\right) 2 .
\end{aligned}
$$

Therefore by Observation 1.4, we have

$$
\begin{gathered}
\boldsymbol{\varepsilon}=\frac{\sum \boldsymbol{d}(\boldsymbol{v})}{\mathbf{2}} \\
\boldsymbol{\varepsilon}=4 a_{1} a_{2}-a_{1}-a_{2}
\end{gathered}
$$

Theorem2.8. For an arithmetic graph $G=V_{n}, n=P_{1}{ }^{a_{1}} \times P_{2}, a_{1}>1$ then $\bar{\kappa}(G) \epsilon[1,2)$,Further if $a_{1}$ is increasing then $\bar{\kappa}(G)$ is decreasing.

Proof. Let $G=V_{n}$ be an arithmetic graph where $n=P_{1}{ }^{a_{1}} \times P_{2}$, byobservaion1.1andtheorem2.7, weget the number of pendent vertices are $a_{1}-1$. The contribution to the total connectivity will be reduced if the pendent vertices are increased. Hence $\bar{\kappa}(G)$ is decreasing if $a_{1}$ is increasing.

Theorem2.9. For an arithmetic graph $G=V_{n}, n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a_{2}}, a_{1}, a_{2} \geq 1$ then $G$ is a bipartite graph.
Proof. Let $G=V_{n}$ be an arithmetic graph, such that $V(G)=X_{1} U X_{2}$, where $X_{1}=\left\{p_{i}, p_{i}, 1 \leq n \leq a_{i} ; i=\right.$ $1,2, \ldots . k\}, X_{2}=\left\{p_{i}{ }^{m} \times p_{j}{ }^{n} ; 1 \leq m, n \leq a_{i}, i=1,2, \ldots . k\right\}$.By the definition of an arithmetic graph no two vertices of the set $X_{1}$ are adjacent as well as no two vertices of the set $X_{2}$ are also adjacent and every edge joins a vertex of $X_{1}$ to a vertex of $X_{2}$. This shows that the graph $G$ is a bipartite graph.

## 3. Conclusion

We conclude by noting that the average connectivity of an arithmetic graph is strictly less than the maximum degree of $G$. Also, for an arithmetic graph $G=V_{n}, n=P_{1}{ }^{a_{1}} \times P_{2}, a_{1}>1$, if $a_{1}$ is increasing then $\bar{\kappa}(G)$ is decreasing and for $G=V_{n}, n=P_{1}{ }^{a_{1}} \times P_{2}{ }^{a}, a_{1}, a_{2} \geq 1, G$ is a bipartite graph. The readers can classify the different arithmetic graphs as in terms of multipartite graphs.
